

Hematolite: a complex dense-packed sheet structure

PAUL B. MOORE AND TAKAHARU ARAKI

Department of the Geophysical Sciences
The University of Chicago, Chicago, Illinois 60637

Abstract

Hematolite, $(\text{Mn}^{2+}, \text{Mg}, \text{Al})_{15}(\text{OH})_{23}(\text{AsO}_3)(\text{AsO}_4)_2$, $Z = 3$, rhombohedral, space group $R\bar{3}$, $a = 8.275(5)$, $c = 36.60(5)\text{Å}$, is a dense-packed oxide structure of unusual complexity. $R = 0.11$ for 1471 independent reflections.

The structure is based on the dense-packed stacking sequence $\cdot hhhch \cdot$ which includes 34 oxygens and one lone electron pair with seven anions per layer. Counting the lone pair as an anion, the general formula is $M_{15}T_3\phi_{35}$, where M = octahedral, T = tetrahedral, and ϕ = anion populations. The arsenite trigonal pyramid is geometrically similar and occurs in an environment similar to that found in synadelphite, $M_9(\text{OH})_9(\text{H}_2\text{O})_2(\text{AsO}_3)(\text{AsO}_4)_2$. The five non-equivalent layers are: (1) isolated octahedra; (2) octahedral and tetrahedral sheet identical to that found in welinite, $\text{Mn}^{4+}\text{Mn}_3^{2+}\text{SiO}_7$; (3) octahedral and trigonal pyramidal sheet much like (2); (4) insular octahedra and tetrahedra, and (5) octahedral sheets of the type $[M_3\phi_7]$ found in chalcophanite. These layers are coupled to each other by corner- and edge-sharing. Hematolite is a key to the more complicated structures of kraisslite, $M_{25}^{2+}\text{Zn}_3(\text{OH})_{12}(\text{AsO}_4)_4(\text{SiO}_4)_8$, and mcgovernite, $M_{19}^{2+}\text{Zn}_3(\text{OH})_{21}(\text{AsO}_3)(\text{AsO}_4)_3(\text{SiO}_4)_3$. Models are proposed for these structures and for dixenite, $\text{Mn}_{11}^{2+}\text{Mn}_3^{3+}(\text{OH})_6(\text{AsO}_3)_6(\text{SiO}_4)_2$.

Polyhedral averages are $M(1)\text{-O}$ 2.23, $M(2)\text{-O}$ 2.22, $M(3)\text{-O}$ 2.21, $M(4)\text{-O}$ 2.23, $M(5)\text{-O}$ 2.04, $M(6)\text{-O}$ 2.15, $M(7)\text{-O}$ 2.00, $\text{As}(1)\text{-O}$ 1.72, $\text{As}(2)\text{-O}$ 1.79, $\text{As}(3)\text{-O}$ 1.69 Å, with $\text{As}(2) = \text{As}^{3+}$. The proposed site distributions are: $M(1) = M(2) = M(3) = M(4) = 1.00 \text{ Mn}^{2+}$, $M(5) = 0.44 \text{ Al}^{3+} + 0.40 \text{ Mg}^{2+} + 0.16 \text{ Mn}^{2+}$, $M(6) = 0.56 \text{ Mn}^{2+} + 0.44 \text{ Mg}^{2+}$, and $M(7) = 0.58 \text{ Al}^{3+} + 0.19 \text{ Fe}^{3+} + 0.23 \text{ Mn}^{2+}$. It is suggested that the ordering scheme optimizes fitting between the sheets.

Introduction

Hematolite, a highly basic arsenite-arsenate of manganese and aluminum, is only known from the Eastern Moss Mine, Nordmark, Värmland, Sweden, where it occurs locally in a basic fissure assemblage associated with calcite, barite, manganosite, pyrochroite, and several other basic manganous arsenates. Our motivation for this study stems partly from its relationship to the other basic arsenate structures shown to be complex articulations of crystallographic dense-packings (Moore, 1967, 1970) and partly because of its relationship with mcgovernite (Wuensch, 1960), a complex species which has the curious property of possessing the largest cell edge yet recorded (other than polytypes) in an inorganic material (204Å!).

We shall offer some additional clues to the mcgovernite structure and, with the hematolite structure at

hand, feel confident that knowledge of its structure will be "right around the corner."

Experimental details

Owing to the typically bent aspect of hematolite single crystals, difficulty was encountered in obtaining an individual suitable for crystal structure analysis. Our crystal was selected from sample 28939 of the Swedish Natural History Museum, and it is believed that this was one of the specimens which Sjögren (1885) used for his study. The crystal, a flat rhombohedron, measured 0.14 mm along c and 0.25 mm along the a_1 - and a_2 -axes and could be described satisfactorily by 14 plane faces. A relatively high mosaic spread with an aggregate of multiple splittings for individual reflections required that cell parameters be determined on calibrated precession films ($\text{MoK}\alpha$ radiation) which yielded $a = 8.275(5)$, $c =$
