

HIGHLIGHTS AND BREAKTHROUGHS

The crystallographic and petrogenetic significance of pegmatite phosphates

FRÉDÉRIC HATERT^{1,*}

¹Laboratoire de Minéralogie, Université de Liège, B-4000 Liège, Belgium

Abstract: The paper describing the new phosphate mineral correianevesite, recently published by Chukanov et al. (2014), clearly demonstrates the importance of pegmatite phosphates. For material scientists, these minerals are a source of new structure types; for petrologists, they constitute valuable tools necessary to accurately determine the temperature conditions prevailing during pegmatite differentiation processes. **Keywords:** Phosphates, pegmatites, crystal chemistry, petrography, geothermometry
