

Analysis of Disordered Materials Using Total Scattering and the Atomic Pair Distribution Function

Thomas Proffen

tproffen@lanl.gov

LA-UR 05-1010

LA-UR 06-6075

The challenge of *real* materials

- Traditional crystallographic approach to structure determination is insufficient or fails for
 - Non crystalline materials
 - Disordered materials: The interesting properties are often governed by the defects or local structure !
 - Nanostructures: Well defined local structure, but long-range order limited to few nanometers (-> badly defined Bragg peaks)
- An approach to determine **local** and **nano-scale** structures is needed.

Nanostructures: *Science* (290) 2000

Total scattering ?

Cross section of 50x50x50 u.c. model crystal consisting of 70% black atoms and 30% *vacancies* !
Properties might depend on vacancy ordering !!

Bragg peaks are blind ..

Bragg scattering: Information about the *average* structure, e.g. average positions, displacement parameters and occupancies.

Diffuse scattering to the rescue ..

Diffuse scattering: Information about *two-body correlations*, i.e. chemical short-range order or local distortions.

RUN

[Postscript] [Close window]
Created: 08. Jun 2003 at 05:12 PM

Created using the programs [DISCUS](#) and [KUPLOT](#)

$$I_{\text{SRO}} = - \sum_{ij} \sum_{lmn} c_i c_j f_i f_j \alpha_{lmn}^{ij} \cos(2\pi \mathbf{k} \cdot \mathbf{r}_{lmn})$$

How about powder diffraction ?

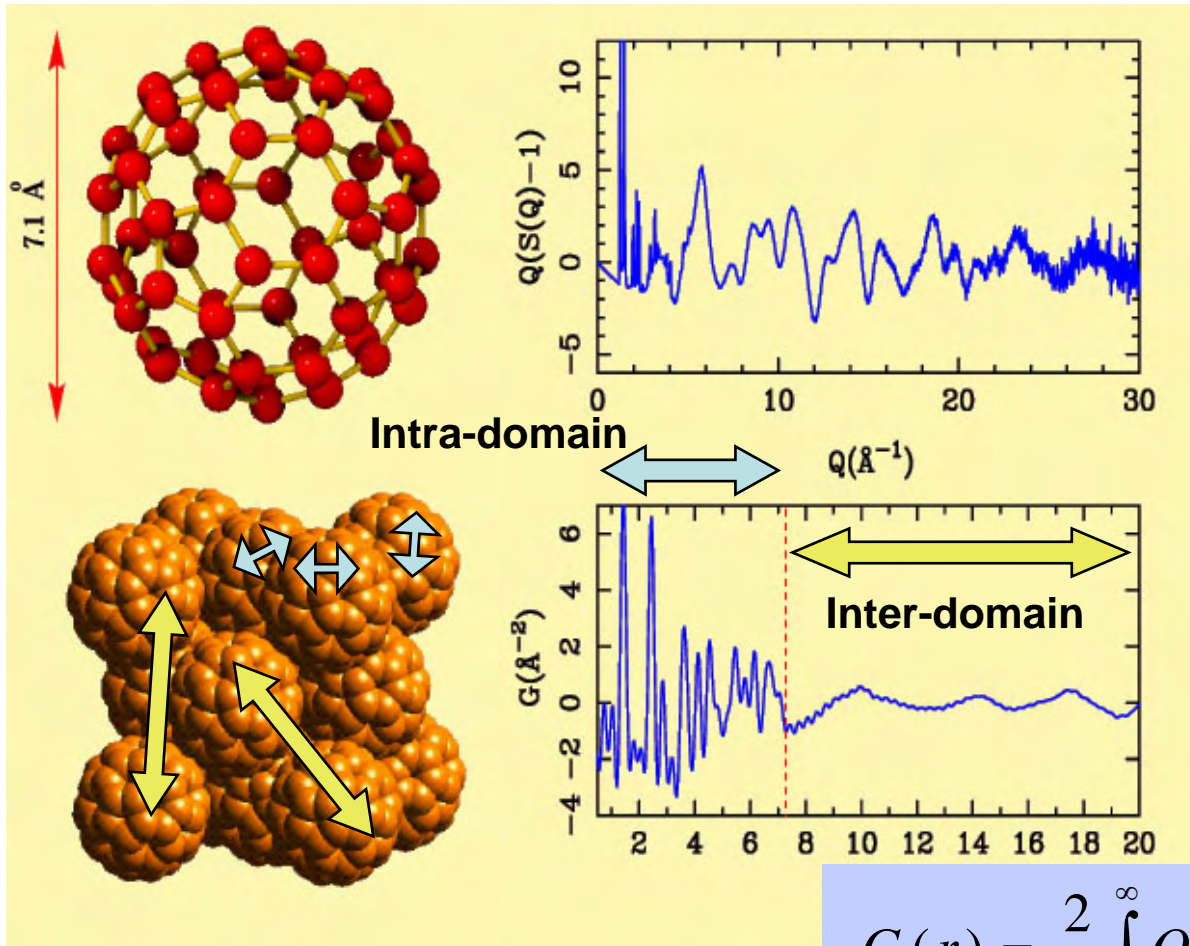

Finally the Pair Distribution Function (PDF)

The PDF is the **Fourier transform** of the **total scattering** diffraction pattern !

Proffen, Z. *Krist*, **215**, 661 (2000)

What is a PDF?

Example:
C₆₀ - 'Bucky balls'

The PDF (similar to the Patterson) is obtained via Fourier transform of the **normalized total scattering** $S(Q)$:

$$G(r) = \frac{2}{\pi} \int_0^{\infty} Q [S(Q) - 1] \sin(Qr) dQ$$

$$Q = 4\pi \sin \theta / \lambda$$

Instruments and Software

What is required to obtain high quality PDFs ?

The PDF (similar to the Patterson) is obtained via Fourier transform of the **normalized total scattering** $S(Q)$:

$$G(r) = \frac{2}{\pi} \int_0^{\infty} Q [S(Q) - 1] \sin(Qr) dQ$$

Requirements to obtain 'good' PDF:

- High maximum momentum transfer, Q_{\max} .
- High Q-resolution.
- Good counting statistics @ high Q.
- Low instrument background

Where ?

Synchrotron sources
(high energy X-rays)

or

spallation neutron sources
(reactor neutron energies are too low)

What makes a good PDF: Influence of Q_{\max} ...

Termination of integral at Q_{\max} results in convolution of $G(r)$ with $\sin(Q_{\max} r)/r$.

ZnSe_{0.5}Te_{0.5} data collected on GEM terminated at 40 \AA^{-1} and 17 \AA^{-1}
 NN split unresolved at 17 \AA^{-1} !

What makes a good PDF: Influence of Q resolution ...

Comparison of measurements of Nickel powder on instruments GLAD at IPNS and NPD at MLNSC.

PDF goes
"Nano"

High Q resolution: Large r range (PDF dampened by $\exp -(r\Delta Q)^2/2$)

NPfDF: Overview

Specifications

- Upgrade finished Sep. 2002
- L1: 32m, $Q_{\max}=50\text{\AA}^{-1}$, $\Delta d/d=0.15\%$
- Typical PDF measurement 1 - 4 hrs
- Sample amounts down to 200 mg
- Ancillary: 10K-1500K, soon: 0.5K, 11T

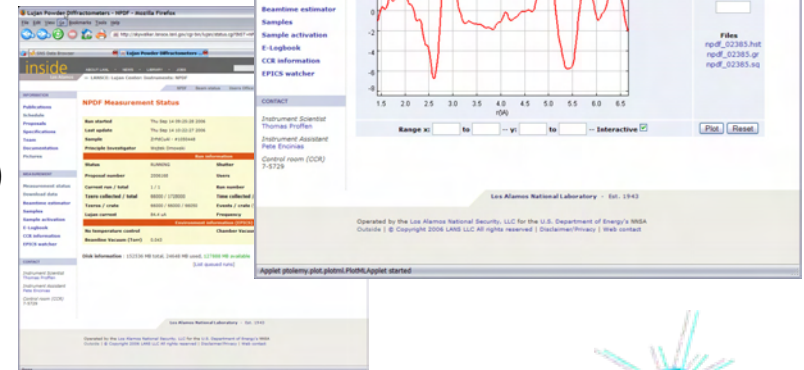

Science

- 95% PDF studies, hard matter
- Many users *new* to PDF
- Oversubscription in 2006: ~1.6

Software

- Web based instrument interface
- Automatic creation of PDF
- Integration in SNS data portal (soon)

Neutron data processing

Corrections,
Normalization, ..

Cylindrical Time-Of-Flight geometry
(energy dispersive)

Typical characterization runs

- Empty instrument (B)
- Empty Container (C)
- Empty Container background (CB)
- Vanadium (V)
- Vanadium background (VB)
- Sample (S)

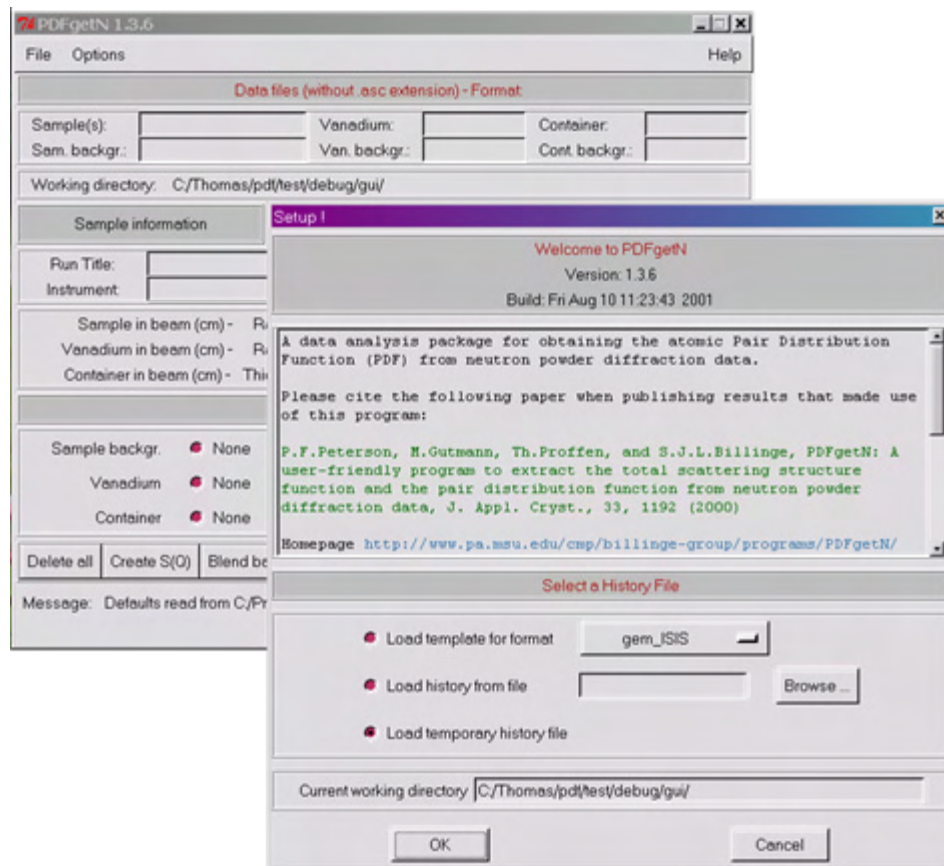

$$G(r) = \frac{2}{\pi} \int_0^{\infty} Q[S(Q)-1] \sin Qr dQ$$

$$S_{\text{corr}} = [(S-SB) - \alpha(C-CB)] / [V-VB]$$

PDFgetN

- Based on GLASS package.
- Graphical users interface & integrated plotting.
- Supports most TOF neutron powder file formats.
- Records all processing parameters as part of output files $G(r)$ and $S(Q)$.
- Runs on Windows 95/98/NT/2000 and UNIX

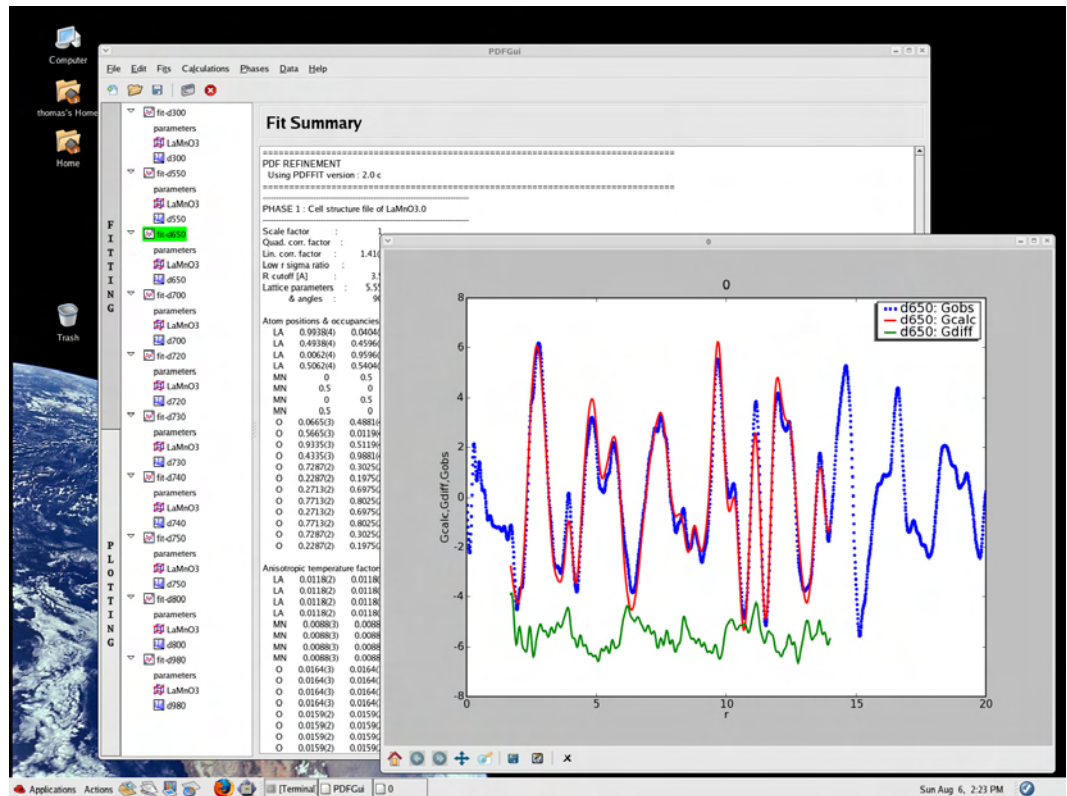

Peterson et al., *J. Appl. Cryst.* **33**, 1192 (2000)

How to model PDF data ?

- Single peak fitting
 - PDF peak position / widths as function of T,x,P,..
 - PDF peak widths as function of r \Rightarrow correlated motion, ..
- Modeling based on structural model
 - Comparison to average crystal structure
 - **DISCUS**: Large model systems, using e.g. RMC
 - **PDFFIT**: 'Real space Rietveld' (few unit cells)
- Compare to theoretical predictions
 - let the theorist do the work ..

Next generation PDFFIT (under development)

- PDFFIT2 and PDFgui
- Part of the DANSE project.
- NSF award of ~\$12M.

Examples

Local atomic strain in $\text{ZnSe}_{1-x}\text{Te}_x$

Simon Billinge
Thomas Proffen (LANL)
Peter Peterson (SNS)

Facilities: IPNS, Lujan
Funding: DOE, NSF

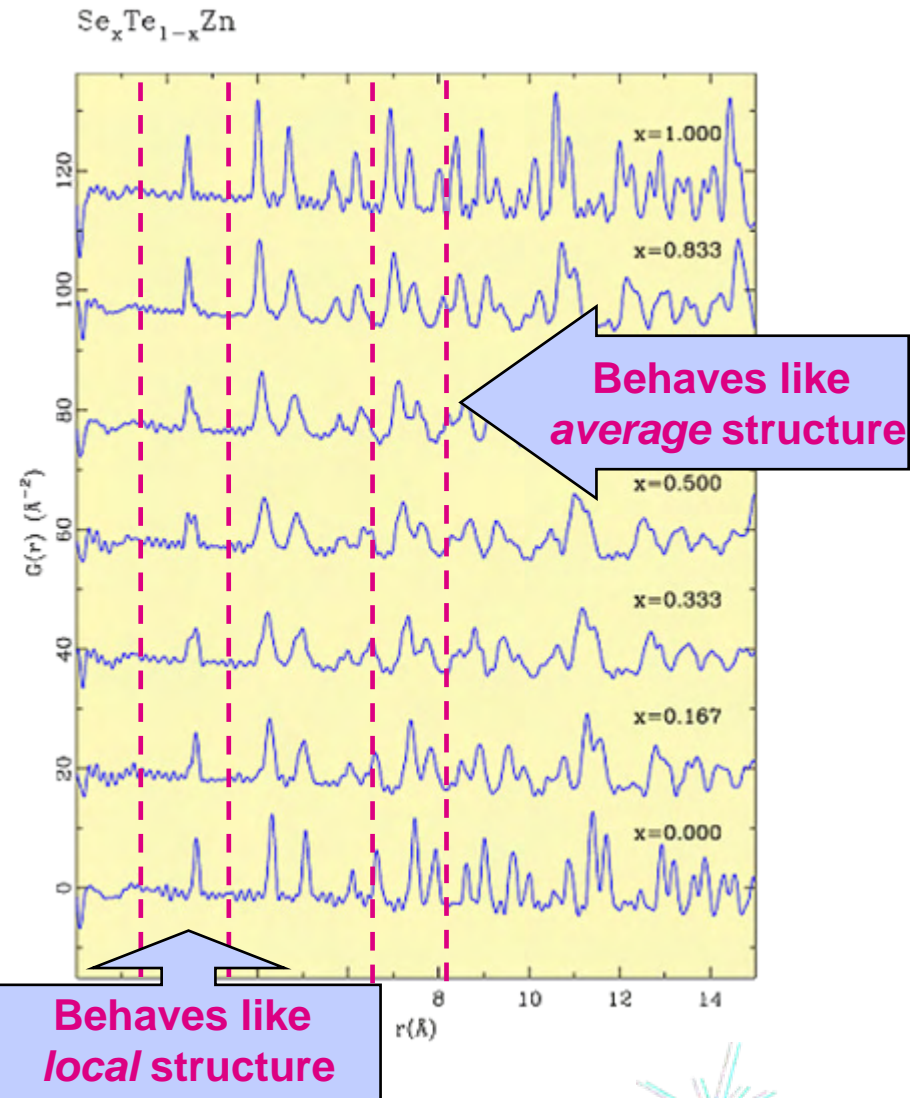

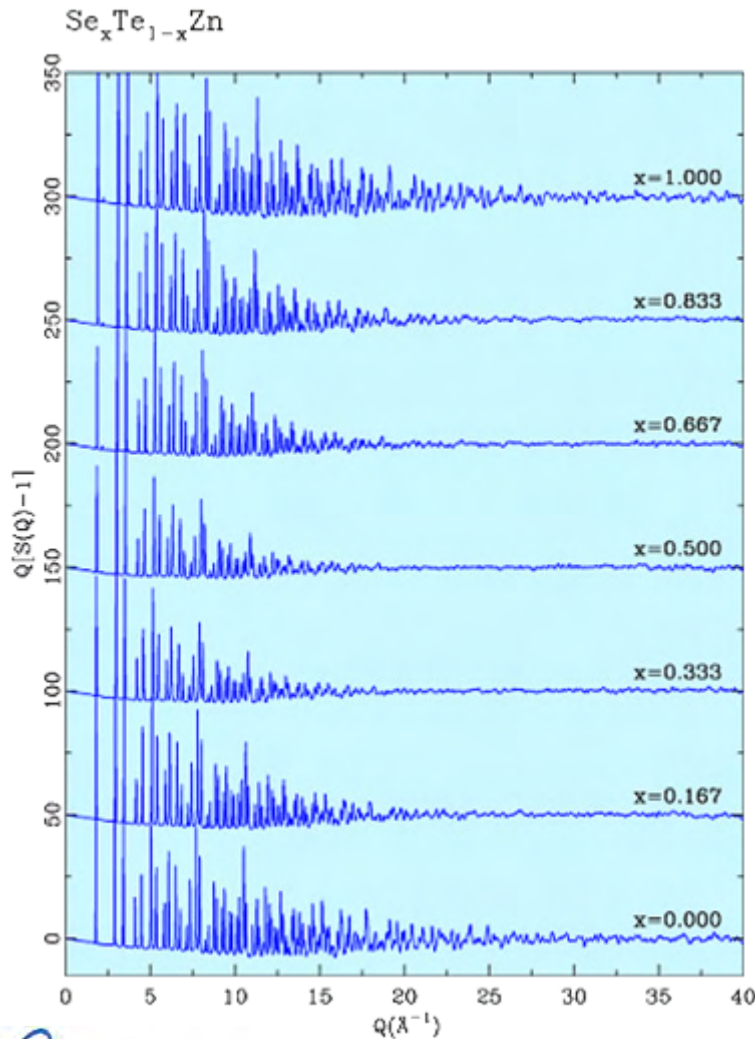

ZnSe_{1-x}Te_x : Structure

- Zinc blend structure (F43m)
- **Technological important** :
Electronic band gap can be tuned by the composition x .
- Bond length difference $Zn-Se$ and $Zn-Te$ \Rightarrow **strain**.
- Local structural probe required !

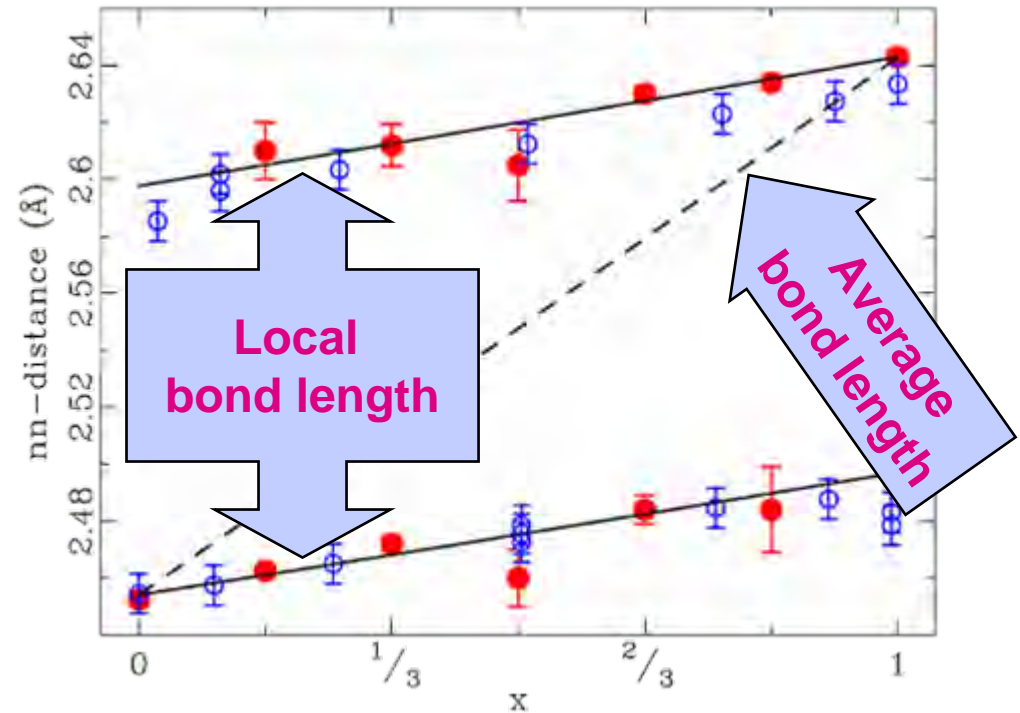

ZnSe_{1-x}Te_x : Total scattering

Peterson et al., *Phys. Rev. B* **63**, 165211 (2001)

ZnSe_{1-x}Te_x : Nearest neighbors and Z-plots ..

BLUE: XAFS from Boyce et al., *J. Cryst. Growth.* **98**, 37 (1989); RED: PDF results.

Jahn Teller Distortion in LaMnO_3

Simon Billinge
Emil Bozin
Xiangyn Qiu

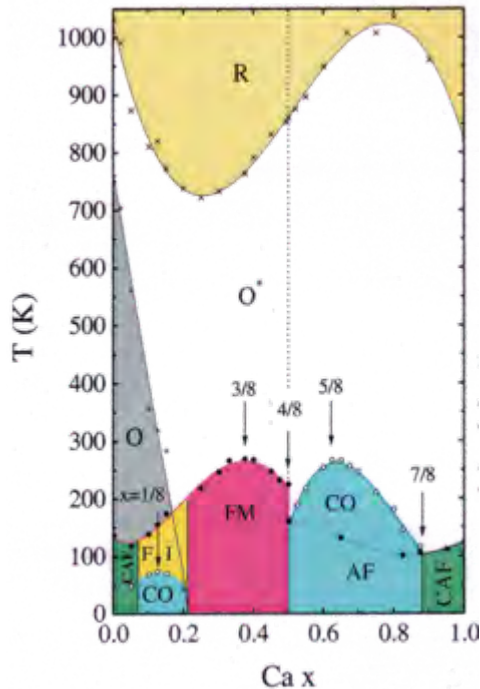

Thomas Proffen

Facilities: Lujan
Funding: DOE, NSF

LaMnO₃: Jahn-Teller distortion

Local structure

Jahn Teller
Long Mn-O bond

Average structure

- Mn-O bond lengths are invariant with temperature, right up into the R-phase
- JT distortions persist locally in the pseudocubic phase
- Agrees with XAFS result: M. C. Sanchez et al., PRL (2003).

LaMnO₃: Jahn-Teller distortion

“Complete” Structure of Gold Nanoparticles

Katharine Page

Thomas Proffen

Ram Seshadri
Tony Cheetham

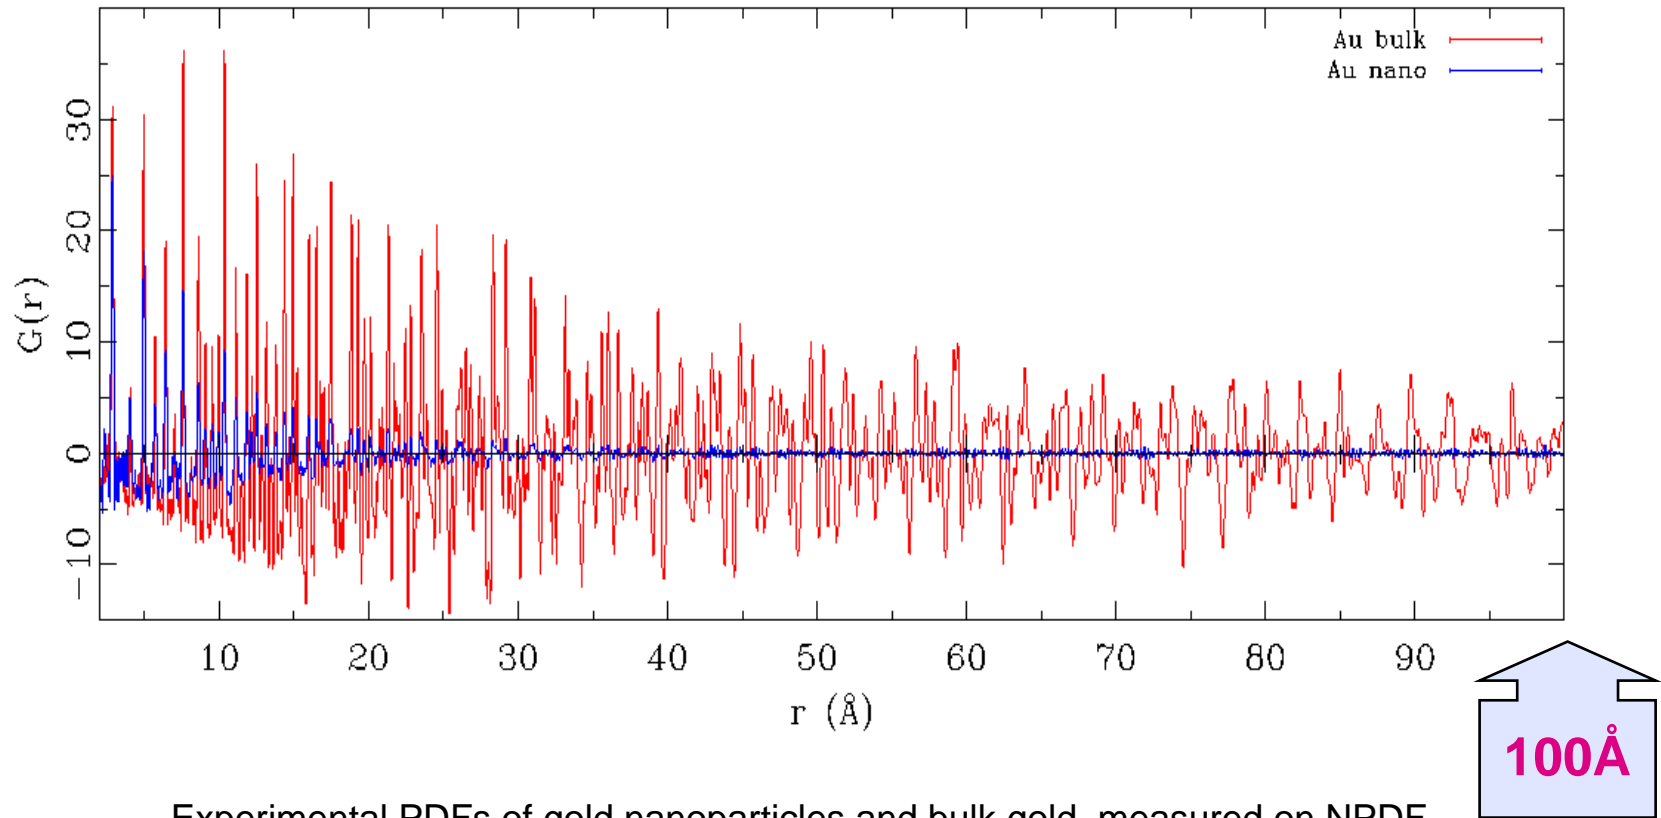

Facilities: Lujan
Funding: DOE, NASA

Example: Gold nanoparticles

- Nanoparticles often show different properties compared to the bulk.
- Difficult to study via Bragg diffraction (broadening of peaks).
- PDF reveals “complete” structural picture – core and surface.
- This study:
 - 5nm monodisperse Au nanoparticles
 - 1.5 grams of material
 - Neutron measurements on NPDF

Au nanoparticles : Nano vs. bulk

Experimental PDFs of gold nanoparticles and bulk gold, measured on NPDF.

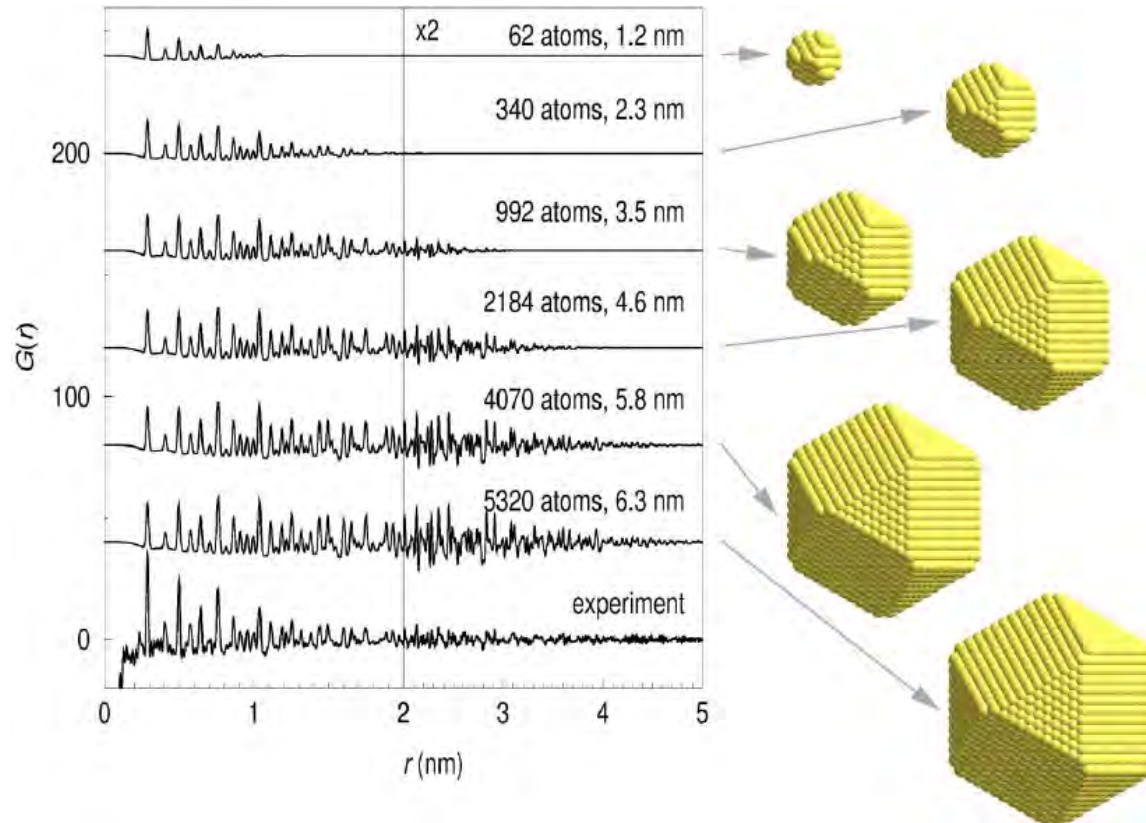

Au nanoparticles : Structural refinements

- PDF from nano- and bulk gold refined using PDFFIT.
- Nanoparticles show “normal” gold structure.
- No indication of surface relaxations.
- $a_{\text{bulk}} < a_{\text{nano}}$
- Indication of Au-cap distances

K.L. Page, Th. Proffen, H. Terrones, M. Terrones, L. Lee, Y. Yang, S. Stemmer, R. Seshadri and A.K. Cheetham, **Direct Observation of the Structure of Gold Nanoparticles by Total Scattering Powder Neutron Diffraction**, *Chem. Phys. Lett.* **393**, 385-388 (2004).

Au nanoparticles: Particle size

We're dealing with a length scale that can be simulated on an atom by atom basis, perhaps opening the door to extremely detailed refinements.

Au nanoparticles: Particle size

Au nanoparticles: Particle size

Local structure in sandstone

Katharine Page
Christina Herrera

Thomas Proffen
Sylvia McLain
Tim Darling
Jim TenCate

Facilities: Lujan
Funding: DOE, NSF

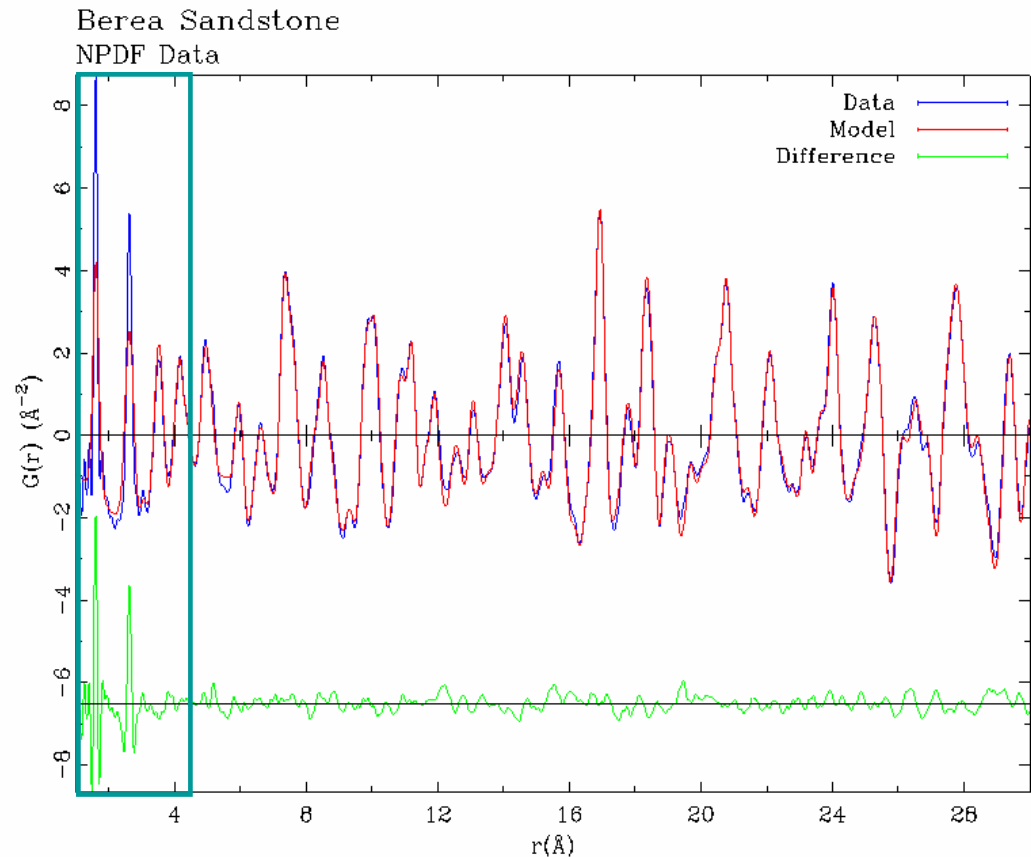

Sandstone: Crystalline quartz ?

- Measured on NPDF
- High statistics data (24 hrs)
- Solid rock sample
- Ambient conditions – sealed to avoid taking up of water
- Motivation: Structural explanation for non-linear acoustic properties

Sandstone: Local structure

- Refinement of single phase quartz model.
- Good agreement above $r > 3\text{\AA}$.
- Missing “intensity” in first two PDF peaks corresponding to **Si-O** and **O-O** NN distances.

Sandstone: Local structure

- Refinement of two phases :
 - Crystalline quartz
 - “Amorphous” quartz up to 3\AA
- Good agreement over complete range
- Amorphous regions “stress formed” by point like contacts at grain contacts ?

K.L. Page, Th. Proffen, S.E. McLain, T.W. Darling and J.A. TenCate, **Local Atomic Structure of Fontainebleau Sandstone: Evidence for an Amorphous Phase ?**, *Geophysical Research Lett.* **31**, L24606 (2004)

Nano-structured transition metal carbides

Katharine Page
(PhD work)

Ram Seshadri
Tony Cheetham

Thomas Proffen

Facilities: Lujan

UNCLASSIFIED

Nanostructures transition metal carbides

Catalytic activity of platinum group metals with greater thermal stability and resistance to poisoning.

Nanostructured Mo and W carbide will provide higher surface area than traditionally prepared materials.

Prepared by treating molybdates/tungstates in a quartz tube with flowing 50%-H₂/CH₄ at 10 mL/min at elevated temperatures.

NPDF measurements

XPS studies suggest there is a significant contribution of non-carbide carbon. *It is known that graphitic carbon can block almost all of the active surface.*

The difference curve, fit with the graphite structure.

Summary and more information

- Analysis of total scattering gives valuable insight in **structure** \leftrightarrow **properties relationship**
- **High-resolution instruments** open the door to **medium-range order** investigations
- Obtain structural information from disordered crystalline, amorphous or composite materials
- Fast powder measurements allow systematic exploration of local structure as function of T , x , P
