### **ABSTRACT**

We measured the sound velocity of Fe<sub>3</sub>S at room temperature up to 85 GPa employing inelastic X-ray scattering to better constrain the constitution of the inner core. The density of Fe<sub>3</sub>S was also determined by X-ray diffraction under the same conditions. The relation of the P-wave velocity ( $v_p$ ) and density ( $\rho$ ) of Fe<sub>3</sub>S follows Birch's law,  $v_p(\text{m/s}) = 1.14(5) \times \rho(\text{kg/m}^3) - 2580(410)$ . Based on Birch's law determined here for Fe<sub>3</sub>S and that for  $\epsilon$ -Fe reported previously, we found that sulfur decreases both density and compressional velocity of hcp-Fe at the core pressure and 300 K.
