LISTS OF THE ORTHORHOMBIC MINERALS INCLUDED IN GOLDSCHMIDT'S WINKELTABELLEN. EDGAR T. WHERRY. *Washington, D. C.*—As the prism zone is on the whole most characteristic of orthorhombic crystals, it has seemed desirable to arrange the minerals of this system in the order of increasing values of axis *a*.

## PERI-ORTHORHOMBIC

Mica group.....	Monoclinic
Polybasite.....	Monoclinic

## NOTES AND NEWS

A CALCIUM PHOSPHATE WITH RATIOS BETWEEN THOSE OF TRIPLITE AND SARCOPSIDE. EDW. F. HOLDEN. *Hillsboro, N. H.*—In the writer's note on sarcopside in the May number of this magazine (pages 99-102), the formula-types of the various fluo-phosphates and related minerals were compared, in table 3; it was also noted in discussing that table that a ferrous fluo-phosphate from Stoneham, Maine, has been found to show a composition lying approximately midway between the sarcopside and apatite ratios,  $R:(F, OH):(PO_4) = 12 : 3 : 7$ . The purpose of the present note is to call attention to another apparently intermediate mineral, also from Stoneham, the analysis of which is given (as a peculiar "apatite") in *U. S. Geol. Survey Bull* 591, p. 349. The ratio derivable from this analysis is  $11 : 6 : 4$ , which is  $\frac{2}{3}$  of the way from sarcopside to triplite ( $7 : 2 : 4 + 2 \times (2 : 1 : 1) = 11 : 6 : 4$ ). The chief base in this mineral is calcium, so the member of the triplite group concerned is spodosite; but the properties of the Stoneham mineral are so unlike those ascribed to spodosite as to make its distinctness seem at least possible. Studies of the optical properties, with special reference to homogeneity, of minerals appearing to occupy intermediate positions in the series are necessary, however, before their status can be settled.
