

The crystal structure of bredigite and the genealogy of some alkaline earth orthosilicates

PAUL BRIAN MOORE AND TAKAHIARU ARAKI

Department of the Geophysical Sciences, The University of Chicago
Chicago, Illinois 60637

Abstract

Bredigite, $(\text{Ca}, \text{Ba})\text{Ca}_{13}\text{Mg}_2[\text{SiO}_4]_{16}$, $Z = 2$, $a = 10.909(9)\text{\AA}$, $b = 18.34(1)\text{\AA}$, $c = 6.739(9)\text{\AA}$, space group $P2_{1n}$, possesses a crystal structure based on a new kind of pinwheel arrangement. $R(hkl) = 0.108$ ($R_w(hkl) = 0.059$) for 1977 independent reflections.

The space group genealogy for bredigite is: $P2_{1n} \leftarrow Pmnn \leftarrow Pmcb \leftarrow Cmcn \leftarrow P6_3/mmc$. Its idealized arrangement is based on $Pmcb$, $a' = a/2$, $b' = b$, $c' = c$, but ordering of Ba^{2+} and minor Mn^{2+} leads to $Pmnn$ with $a' = a$. Tilting of the tetrahedra lowers the symmetry to $P2_{1n}$.

It is proposed that bredigite is an ordered Ca:Mg compound with a probable composition range between $\text{Ca}_{14}\text{Mg}_2[\text{SiO}_4]_{16}$ and $\text{BaCa}_{13}\text{Mg}_2[\text{SiO}_4]_{16}$. The ideal polyhedral formula is $X^{12}X_2^*Y_4^{10}M^6[T\text{O}_4]_{16}$, where X and Y are large polyhedra, M is the octahedron and T the tetrahedron. Evidence, based on combinatorial analysis and calculated powder patterns, suggests that proper definitions of phases in the system $\text{BaO}-\text{CaO}-\text{MgO}-\text{SiO}_2$ require careful single crystal studies.

Introduction

Bredigite—an important phase in the crystal chemistry of cements, clinkers, slags, and fertilizers—has fostered contention among silicate scientists since its original recognition as a discrete species. In the system $\text{CaO}-\text{MgO}-\text{SiO}_2$, Nature has been particularly perverse in Her choice of what shall be deemed stable. These compounds share all the problems encountered in substructure-superstructure relations, twinning, exsolution, order-disorder, and grotesque stoichiometry. We hope that some questions may be answered in this study but we fear that just as many answers in the earlier studies must be questioned. In particular, detailed single crystal studies are required—and urgently needed—to properly establish the relationships between composition and stability among the phases.

Experimental

The type specimen of Middlesbrough spiegeleisen slag described by Tilley and Vincent (1948) (University of Cambridge specimen number 47706) was kindly placed at our disposal by Professor S. O. Agrell. The bredigite occurs as long prismatic crystals with hexagonal cross-section up to 2 mm in length parallel to the c axis, which project into the cavities of the melilite groundmass. Twinning on (110) occurs for most of the crystals but is superficially concealed

owing to the pseudo-hexagonal subcell. Several crystals were extracted from the cavities; the sixth crystal examined by X-ray single crystal photography was free from twinning but showed the persistent extra diffuse reflections which Douglas (1952) attributed to the presence of the trigonal phase. This phase, also an alkaline earth orthosilicate, possesses $a = 5.46\text{\AA}$, ($b = a\sqrt{3} = 9.46\text{\AA}$), $c = 6.76\text{\AA}$ and is oriented with its a^* and b^* reciprocal lattice vectors parallel to those of bredigite. At low angles, the reflections of the trigonal phase severely overlap those hkl reflections of bredigite for which $(h, k = 2n)$, $h + k = 4n$. The crystal selected for complete structure analysis was a symmetrical prism $0.12 \times 0.12 \times 0.20$ mm in dimension. The cell data, obtained from calibrated precession photographs, are $a = 10.909(9)\text{\AA}$, $b = 18.34(1)\text{\AA}$, $c = 6.739(9)\text{\AA}$ and the extinction criteria are compatible with the space groups $Pmnn$ or $P2_{1n}$, confirming the observations of Douglas (1952).

The crystal was mounted parallel to its c axis on a PALRED automated diffractometer utilizing graphite monochromatized $\text{MoK}\alpha_1$ ($\lambda = 0.70926\text{\AA}$) radiation, $2\theta_{\text{max}} = 60^\circ$, and the data were gathered from the $l = 0$ through the $l = 9$ levels. Other salient details: scan speed 1°min^{-1} , background counting times 20 sec, scan ranges from 3.6° to 5.2° (the latter at higher levels). Reflections in the blind region of the apparatus were photographically estimated but not in

PREDIGIT
