

Structural chemistry of borosilicates, part II: Searlesite, $\text{NaBSi}_2\text{O}_5(\text{OH})_2$: Absolute configuration, hydrogen locations, and refinement of the structure

SUBRATA GHOSE AND CHENG WAN

Department of Geological Sciences, University of Washington
Seattle, Washington 98195

Abstract

Searlesite, $\text{NaBSi}_2\text{O}_5(\text{OH})_2$ is monoclinic, space group $P2_1$, with cell dimensions: $a = 7.9814(12)$, $b = 6.0657(8)$, $c = 4.9054(4)\text{\AA}$, and $\beta = 93.95(1)^\circ$. The absolute configuration and hydrogen positions have been determined from a refinement of the structure using SII reflections measured by $\text{CuK}\alpha$ radiation, and the atomic coordinates determined by Kravchenko (1964). The structure has been refined using anisotropic temperature factors for all atoms except hydrogen to an R factor of 0.035 for 1694 reflections measured by $\text{MoK}\alpha$ radiation. The crystal structure of searlesite consists of highly kinked pyroxene-type silicate chains parallel to the c axis, connected through corner-sharing $\text{BO}_2(\text{OH})_2$ tetrahedra to form borosilicate sheets parallel to the (100) plane; these sheets are held together by spiral columns of edge-sharing Na-O octahedra running parallel to the b axis (as found by Kravchenko, 1964) and by one of the two types of hydrogen bonds. Within the tetrahedral $\text{BO}_2(\text{OH})_2$ group, the O-H distances are 0.87 and 0.88 \AA and the B-O-H angles are 114° and 113° . Both hydrogen atoms are involved in hydrogen bonds, the H...O distances being 2.32 and 2.04 \AA , and the O-H...O angles 147° and 170° . The bridging B-O distances (av. 1.490 \AA) are much longer than the non-bridging B-O distances (av. 1.455 \AA). Within each of the two crystallographically distinct SiO_4 tetrahedra, the Si-O bond involving oxygen belonging to the Si-O-B bridge is significantly shorter (av. 1.591 \AA) than those involving oxygens belonging to the Si-O-Si bridges (Av. Si-O 1.617 \AA). The average B-O, Si(1)-O and Si(2)-O distances are 1.472, 1.614, and 1.608 \AA respectively. The $\text{NaO}_2(\text{OH})_4$ octahedron is highly distorted; the average Na-O distance is 2.485 \AA .

Introduction

In part I of this series of papers on the structural chemistry of borosilicates, we have described the structure of garrelsite, $\text{NaBa}_3\text{Si}_2\text{B}_7\text{O}_{16}(\text{OH})_4$ (Ghose, Ulbrich, and Wan, 1975). Garrelsite contains a new type of borosilicate chain, consisting of two types of four-membered rings with alternating B- and Si-tetrahedra; in addition, there is a $[\text{B}_5\text{O}_{12}]$ polyanion, consisting of three borate tetrahedra and two borate triangles.

In this paper we present the details of the structure of searlesite, $\text{NaBSi}_2\text{O}_5(\text{OH})_2$. This mineral is widespread in the Searles Lake area in California and in the Green River formation in Utah and Wyoming. The unit cell dimensions and space group of searlesite were determined by Fahey and Axelrod (1950). The crystal structure was determined by Kravchenko (1964) using an acicular crystal from Cave Springs, Nevada. Kravchenko (1964) collected intensity data

on 1524 (1258 non zero) reflections by visual estimation from Weissenberg films. The structure was refined by the least-squares method using isotropic temperature factors to an R factor of 19.5 percent for all reflections and 13.9 percent for non-zero reflections. The hydrogen positions were not determined. We have undertaken a further refinement of the searlesite structure, first, to obtain more precise bond distances and angles (Si-O-B angles in particular) and compare them with other borosilicates; second, to determine the absolute configuration; and third, to determine the hydrogen positions directly and discuss the nature of the hydrogen bonding.

Crystal data

The cell dimensions of an acicular crystal from Cave Springs, Nevada, were determined by the least-squares refinement of 15 reflections with 2θ values between 35° and 45° measured with $\text{MoK}\alpha$ radiation
