

## SUPPLEMENTARY MATERIAL

**FIGURE S1.** Sample assembly for Fay\_33. The pressure medium consists of a 6mm cube of boron epoxy. The interior consists of nested sleeves surrounding a cylindrical sample. Two thermocouple are introduced on opposite sides of the assembly. The confining medium consists of NaCl with 10% BN.

**TABLE S1.** Residual plastic strain and peak stress for EPSC simulations.

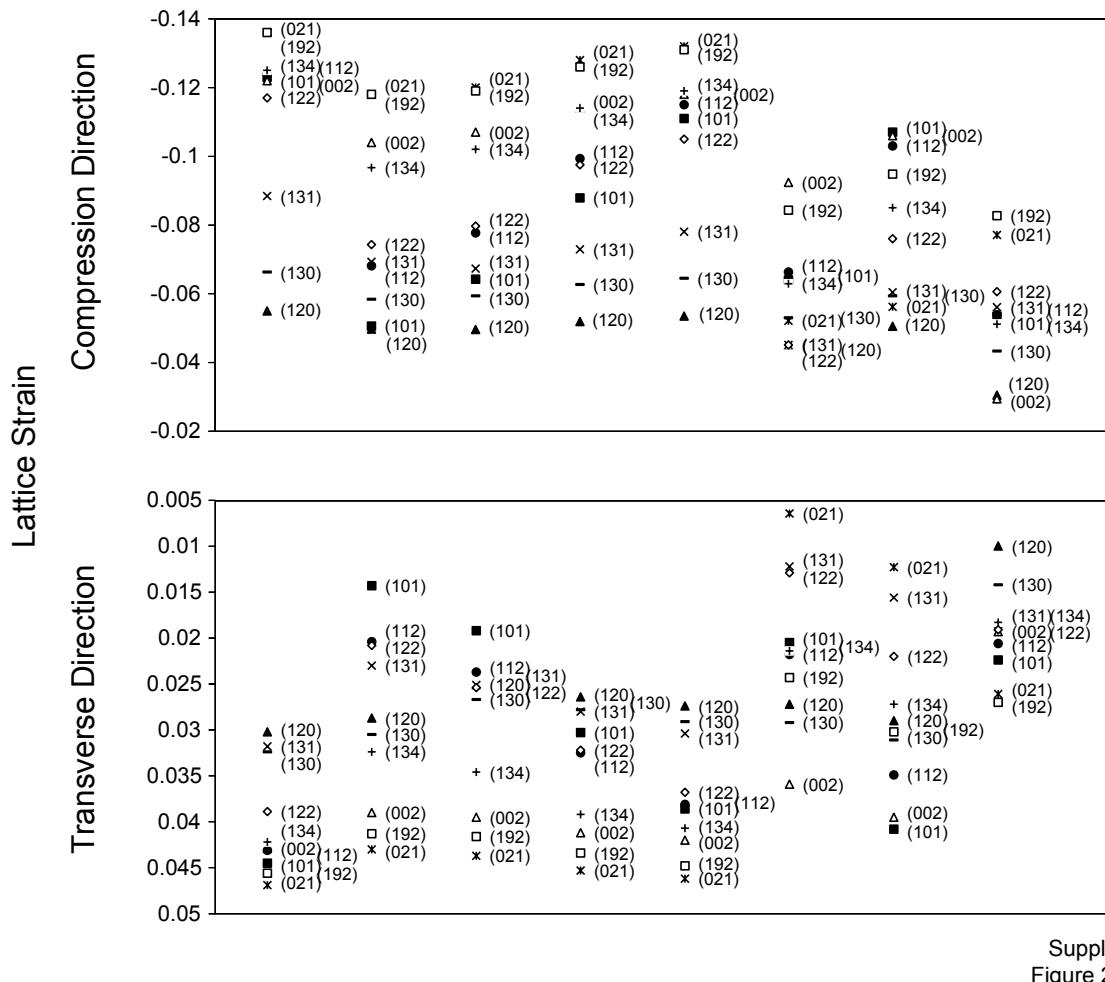

Slip systems	Final strain (%) after unload	Peak stress as % of elastic only case
elastic deformation	0.0%	100.0%
(010)[100]	-1.0%	81.3%
(010)[001]	-1.3%	79.6%

(011)[100], (010)[001]	-6.0%	48.1%
{021}[100], {110}[001]	-5.9%	47.5%
(010)[100], (001)[100], (010)[001]	-6.3%	45.8%
{011}[100], {021}[100], {110}[001]	-6.3%	45.5%
{011}[100], {110}[001]	-6.4%	45.3%
All slip systems	-6.4%	43.1%
Kink system*	-8.7%	35.6%
(010)[100] & Kink system*	-9.1%	33.4%
{031}[100] & Kink system*	-9.2%	32.8%
{021}[100] & Kink system*	-9.2%	32.4%
{011}[100] & Kink system*	-9.6%	31.0%
(001)[100] & Kink system*	-9.7%	30.3%
(100)[001] & Kink system*	-10.0%	28.3%
{110}[001] & Kink system*	-10.3%	26.2%
All slip systems with Kink system*	-10.8%	22.7%

\* [-210] on (120), [210] on (1-20), [-504] on (405) and [-50-4](40-5)

Notes: Residual plastic strain is calculated after unloading. Peak macroscopic stress (at a strain of 0.14) is given as a percentage of peak stress for the elastic-only case (19.53 GPa). All simulations were run with  $\tau_0 = 1.5$ ,  $\tau_1 = 0.5$ ,  $\phi_0 = 0.01$  and  $\phi_1 = 0.01$  for all slip systems as well as the kink band system. Shortening strain is negative.
