a: Raman-active OH bands; b: IR-active OH bands.

Appendix Table 3. Raman and infrared measurements for humite-group minerals with various fluorine and titanium concentrations under ambient condition. The integral intensities below and above 3450 cm^{-1} are estimated from the reported spectra.

Mineral	X_{Ti}	X_{F}	$I_{<3450}/I_{>3450}$	Reference
F-rich ($X_{\text{F}} \geq 0.33$) samples by FTIR measurements (Fig. 7a)				
Chondrodite	0.05	0.73	0.47(5)	Williams (1992)
Chondrodite	0.02	0.88	0.25(3)	Cynn et al. (1996)
Chondrodite	0.02	0.37	0.42(4)	Kurabayashi et al. (2004)
Humite	0.016	0.33	0.43(2)	This study
Norbergite	0.03	0.63	0.85(3)	--
Ti-rich ($X_{\text{Ti}} \geq 0.08$) samples by FTIR measurements (Fig. 7b)				
Clinohumite	0.45	0	4.81(5)	Shen et al. (2014)
Clinohumite	0.33	0	3.36(3)	--
Clinohumite	0.18	0	2.45(2)	--

Clinohumite	0.39	0.17	1.16(9)	--
Clinohumite	0.41	0.14	6.75(7)	--

X_{F} is $\text{F}/(\text{F}+\text{OH})$ in moles. X_{Ti} is the fraction of Ti at the M3 site.
